

# Homework 9 and Study Problems - MATH 225

---

In this document, you will find two types of problems: homework and study problems. You are required to submit **only the homework problems** to Gradescope. The study problems are intended to help you grasp the topics thoroughly and prepare for exams. It is strongly advised to attempt all study problems for a comprehensive understanding.

Please submit your homework to Gradescope until **April 10, 11pm**.

## Homework problems

- Let  $A$  and  $B$  be  $n \times n$  matrices, and assume that  $v \in \mathbb{R}^n$  is an eigenvector of  $A$  corresponding to the eigenvalue  $\lambda$  and also an eigenvector of  $B$  corresponding to the eigenvalue  $\mu$ .
  - Prove that  $v$  is an eigenvector of the matrix  $AB$ . What is the corresponding eigenvalue?
  - Prove that  $v$  is an eigenvector of the matrix  $A + B$ . What is the corresponding eigenvalue?
- Determine whether the given matrix is defective or nondefective.

$$A = \begin{bmatrix} 2 & 3 \\ 2 & 1 \end{bmatrix}, \quad A = \begin{bmatrix} 6 & 5 \\ -5 & -4 \end{bmatrix}, \quad A = \begin{bmatrix} 1 & -2 \\ 5 & 3 \end{bmatrix}.$$

- Consider the characteristic polynomial of a  $3 \times 3$  matrix  $A$ ; namely,

$$p(\lambda) = \det(A - \lambda I) = \begin{vmatrix} a_{11} - \lambda & a_{12} & a_{13} \\ a_{21} & a_{22} - \lambda & a_{23} \\ a_{31} & a_{32} & a_{33} - \lambda \end{vmatrix}$$

which can be written in either of the following equivalent forms:

$$p(\lambda) = -\lambda^3 + b_1\lambda^2 + b_2\lambda + b_3,$$

$$p(\lambda) = (\lambda_1 - \lambda)(\lambda_2 - \lambda)(\lambda_3 - \lambda),$$

where  $\lambda_1, \lambda_2, \lambda_3$  (not necessarily distinct) are the eigenvalues of  $A$ .

- Use the given equations to show that

$$b_1 = (a_{11} + a_{22} + a_{33}),$$

$$b_3 = \det(A).$$

Recall that the quantity  $a_{11} + a_{22} + a_{33}$  is called the *trace* of the matrix  $A$ , denoted  $\text{tr}(A)$ .

(b) Use the given equations to show that

$$b_1 = (\lambda_1 + \lambda_2 + \lambda_3),$$

$$b_3 = \lambda_1\lambda_2\lambda_3.$$

(c) Use your results from (a) and (b) to show that

$$\det(A) = \text{product of the eigenvalues of } A,$$

$$\text{tr}(A) = \text{sum of the eigenvalues of } A.$$

**Remark.** We ask for the proof of  $3 \times 3$  case, but this is true for any  $n \times n$  matrix.

4. Prove the following properties for similar matrices:

(a) A matrix  $A$  is always similar to itself.

(b) If  $A$  is similar to  $B$ , then  $B$  is similar to  $A$ .

(c) If  $A$  is similar to  $B$  and  $B$  is similar to  $C$ , then  $A$  is similar to  $C$ .

**Hint.** For each part, you should find an invertible matrix  $S$  that satisfies the similarity as in the definition.

5. Determine a complete set of eigenvectors for the given matrix  $A$ . Construct a matrix  $S$  that diagonalizes  $A$  and explicitly verify that  $S^{-1}AS = \text{diag}(\lambda_1, \lambda_2, \dots, \lambda_n)$ .

$$A = \begin{bmatrix} 1 & -3 & 3 \\ -2 & -4 & 6 \\ -2 & -6 & 8 \end{bmatrix}, \quad A = \begin{bmatrix} 3 & -2 & 3 & -2 \\ -2 & 3 & -2 & 3 \\ 3 & -2 & 3 & -2 \\ -2 & 3 & -2 & 3 \end{bmatrix}.$$
